

Swift foods

1. Introduction

Swift foods is a website for users that do not have any time to cook. The user has the option to buy the foods provided individually or the option to buy an monthly plan. If an user chooses to buy the monthly plan, they will pay a monthly fee to have a certain amount of foods delivered to their doorstep. This website will contain many features such as a navigation, a shopping page for users that want to buy foods individually, contact form, and a subscription form. All features will be responsive.

2. User Interface Design and Prototype

I have my wireframes linked in the forum post.

3. Navigation Structure

Swift Food's navigation structure is simple. The website will consist of 5 pages. Four of the pages will be listed in the navigation and the other page will only be accessed by clicking on the order now button on the shop page. The four pages consist of home, about us, shop, and contact. The navigation will be available on all pages.
